DISCLAIMER: PHISHING ATTACKS ARE EXTREMELY UNETHICAL AND ILLEGAL. THEY PRIVIDE HARM AND DECEIVE PEOPLE TOWARDS ENTITIES WE DO WELL. THIS IS NOT A TUTORIAL ON HOW TO CARRY OUT PHISHING ATTACKS, RATHER, TO EDUCATE ALLIERS FOR PHISHING ATTACKS. THIS GUIDE IS FOR EDUCATIONAL PURPOSES AND DELIVERS VIRTUAL PHISHING ENVIRONMENT AND MOST EMAILS.

First of, its very important to understand that Unless upon millions of phishing emails happened every single day worldwide accounting **0 sign Sucess**

https://www.ic.gov/

Due to this, it's clear to learn the ins and outs of phishing email and how to avoid them.

I am sure you are tired by a bombardment of phishing emails a day, you just might not know it since many email providers is a great job of filtering them out and allocating them into spam. Here I will be showing how a phishing email can be created, how they work, and what you should do to mitigate risks.

What you'll need

- A computer (I will be using Ubuntu running Windows 10)
- A email account (I will be using Google gmail account that maybe for testing purposes)
- GoPhish application

GoPhish download: GoPhish

Follow the instructions and download what correspondes to your hardware.

Once downloaded extract and run the GoPhish:

When prompted up, you do potential crash on linux if selected. Make that allow gophish of unlocked. Then you'll find the password in the prompt or cat1 Copy that and paste it into the next step.

- **User**: admin
- **Password**: (paste/type your pw on the prompt, usually a bunch of characters.)
  - You'll then be asked to reset and change the password to anything you want it to be.

Creating a sending profile

1. Navigate to **Sending Profiles > New Profile**
2. Copy the your email account's smtp info
3. Go to **Manage Your Google Account > Security > App Passwords**. Or type "app password" in the search bar in the security tab.

Name it whatever you want and create. You will then be presented with a 16 character password. Copy that and save it for later.

Starting the sending profile

- **Name**: Free choice of name
- **Interface type**: SMTP
- **Host**: smtp.gmail.com:587 (this is Gmail's SMTP server and port)
- **Username**: Your gmail again
- **Password**: The app password you generated

Note: You can send test and email to verify that it works. Use the same gmail and insert your first and last name. Doesn't have to be your government name.

Hit send and once you do, check your gmail inbox you should receive the test email.

Setting Up a Landing Page

A **landing page in GoPhish** is the webpage your targets are redirected to after they click the phishing link in your email.

It is what the **new and cleaned web**, making it one of the most important components of a phishing simulation.

Go to **Landing Pages > New Page**

Name: Give it whatever name you want

HTML: I will provide code. Click the arrow and copy and paste it into the third box.

- **HTML CODE**

Enable the **Capture Submitted Data** and **Capture Password** boxes

This email this code displays:

In the method tab, use **https://www.google.com** This will redirect the user to a real google account page after credentials are used

Save page

Creating an Email Template

Email Templates — is **an email sending method** that gets sent to your targets during a phishing simulation. We can make it convincing.

Go to **Email Templates > New Template**

Name: whatever you want

Subject: **Urgent: Password Reset** (provides a sense of urgency a common trouper of a phishing email.)

- HTML CODE

This is what this code displays:

Enable **Add Tracking Image** and **save page**

Adding Users

Users are the people or test accounts you will send your phishing simulation emails to. They are part of what GoPhish calls a **Group**.

1. Go to **Users & Group > New Group**
2. Give it a group name. You same last name.
3. **In the email address, type your gmail account**.

In a real-world setting, you would add the people with their credentials, but for now, let's test on your email.

Click Save Changes.

Launching the Campaign

A **campaign in GoPhish** is a set of actions and events — including emails sent, clicks on links in emails, credential submitted, landing pages, and sending profiles) and ends out the phishing emails, then tracks everything you targets do.

Go to **Campaigns > New Campaign**

1. Create a name.
2. Templates:
   - Choose the email, Landing templates, select the name you created for each.
3. **Groups**: Select the group you named.
4. For the **URL**, type the ip address that's in your browser. **https://127.0.0.1 for example, yours may vary**.

Click Launch Campaign

Getting the Phishing Email

Now, we are processing the results of the phishing email test. We see that the email has been sent, and you check the group that we used.

We got an email!

As you can see, phishing emails can be highly deceptive and convincing. The logo looks like an authentic email if you don't know any better. Let's see what happens when we try to reset the password.

As you can see, it is prompting the user to enter their credentials. This is a common practice on how scammers collect your dear users. I will show you how the data is collected.

Type in your gmail and password.

After we have entered our credentials, the page then reads and redirects us to an actual google page (The site is typed in the redirect tab to "google" or you, let's go! after a bunch, "left alone!" mentalism)

As you can see, the email has been opened, clicked and submitted since we did check out the email.

Now, we successfully captured and stolen the user's credentials without a VICTIM (the successfully created a seemingly authentic password reset email that redirects you to a real google account page).

Repeatedly, we made off with the necessary information to start having "some crazy stuff.

Conclusion: It is vitally important to realize that phishing emails can transpire anyone. personal and business. If you have or are a target, it is vital to be educated and to prepare ahead. yourself to mitigate as much as possible.
